

## Integrated Field Development Analysis, Optimisation and Forecasting Unconventional Systems

## **Target Audience:**

This course is intended for those that have (i) recently started working in the production domain and need to become familiar with production tools/analysis, (ii) attended the course already some time ago, and require a refresher, or (iii) unrelated disciplines trying to understand the production context (e.g. accountants, project managers, etc..).

## **Overall Objectives:**

- 1/ Developing dexterity in using the **IPM** suite
- 2/ Basic understanding of the physics
- 3/ Understanding the limitation of the methods and techniques used

## **Course Agenda**

- Day 1 Introduction to integrated production system and why an overall approach is necessary Introduction to PROSPER - philosophy and methodology Pressure loss in the wellbore - gravity and friction terms, slip, holdup Importance of PVT VLP flow correlations theory. Important parameters Workshop - building a wellbore model, matching PVT and flow correlations, running sensitivities,
- **Day 2** Introduction to inflow performance models. *Gas lift introduction –design and diagnostics using "Quicklook" for gas lifted wells Inflow performance models – Steady state modelling Introduction to* **RESOLVE** *and* **REVEAL** – *Transient Inflow modelling, PdTd modelling*
- Day 3 Unconventional IPR modelling Importance of production history PVT transformation Calculation of FBHP from measured data
- Day 4 Introduction to GAP theory and capabilities Building a surface network model - linking to PROSPER well models Generation of VLP and IPR curves Linking PROSPER, PdTd and GAP for full field optimisation and forecasting Gas Lift optimisation Well Cycling
- Day 5 Integrated modelling Workshop
